

ABSTRACTTelevision System

A television system is provided including a broadcast data receiver (BDR) for receiving broadcast data from a remote location via cable, satellite or terrestrial means and processing the data. The processed data includes video data for display on a display screen (2) connected to or forming part of the BDR. A plurality of different video display formats are provided for user selection on the display screen and upon selection of a particular video display format a preview of the resulting video display is displayed in a window (6) on the display screen (2).
